

ABSTRACT

Method of creating a list of contents in a device connected to a domestic network and device associated with the method

The present invention relates to a method for creating a list of contents in a controlling device connected to a domestic network, this list itemizing contents supplied by different devices connected to the domestic network. This method consists in sending from the controlling device a command specifying a filtering criterion, in creating in each device a local list on receipt of this command, in transferring each local list from the device in which it has been created to the controlling device and in assembling in the controlling device the local lists received to form the list of contents. The user can thus select a filtering criterion such as, for example, "sports", and view the list of contents involved in this filtering criterion and available on all the devices. The search for a content by the user can thus be carried out quickly.

The invention also relates to the device used according to the method to create a list of contents.
